Importing and exporting

Rolando Gonzalez, 2022

Content

- Exporting Class/function
- Importing Class/function

Exporting

- There are two main ways of exporting classes/functions:
 1. exporting directly with a set name
 2. exporting default letting the function/class importing decide the name

Exporting/importing with a set name

Exporting:

```
export function AFunction(){  
    return({/*Something*/})  
}
```

Importing in file that uses the function:

```
import { AFunction } from './whereever/NameOfFile';
```

But you are allowed to take an alias:

```
import { AFunction as AF } from './whereever/NameOfFile';
```

Exporting default

Exporting:

```
function AFunction(){  
    return ( { /* something */ } );  
}  
  
export default AFunction;
```

importing you can decide the name:

```
import MyOwnName from './whereever/NameOfFile';
```
